

MASTER DIGITAL OPERATIONS MANUAL

Pakistan-China Import Platform

Business Blueprint | PRD Foundation | Operations System

Document Status

Version 0.1 captures all locked decisions finalized so far and establishes the source of truth for future Codex-assisted development.

Document Version	0.1
Document Date	June 29, 2026
Prepared For	Founder / Product Owner
Build Method	Codex-assisted development
Recommended Stack	Next.js + Supabase/PostgreSQL + Cloudflare R2 + Vercel

Confidential planning document. Not legal, tax, or compliance advice. Final legal and regulatory review must be completed before public launch.

Document Control

This manual is intended to operate as the master source of truth for product, business, operations, and technology decisions. Future editions should expand every module into screen-level PRDs, data models, API requirements, SOPs, training material, and acceptance tests.

Version	Date	Status	Description
0.1	June 29, 2026	Foundation	First digital-book edition based on finalized decisions.
0.2	Future	Planned	Screen-by-screen importer portal and admin portal PRD.
1.0	Future	Launch Candidate	Complete development-ready specification.

Table of Contents

1. 1. Executive Summary
2. 2. Locked Decision Register
3. 3. Business Model
4. 4. Target Users and Market Positioning
5. 5. Language and Localization Strategy
6. 6. User Roles and Portals
7. 7. Authentication and Account Access
8. 8. Import Project System
9. 9. Payment, Unpaid Leads, and Refunds
10. 10. Platform-Controlled Communication
11. 11. Integrated Messaging System
12. 12. Factory Database
13. 13. Factory Match Specialist Operations
14. 14. Pakistani Agent System
15. 15. Admin and Super Admin Operations
16. 16. Email and Document Engine
17. 17. Pricing, Unit Economics, and FMS Compensation
18. 18. SEO Strategy
19. 19. Technical Architecture
20. 20. Data Storage, Security, and Privacy
21. 21. Roadmap and Future Expansion
22. 22. Appendix A - Core Workflow Maps
23. 23. Appendix B - Initial Data Model
24. 24. Appendix C - Open Decisions

1. Executive Summary

The Pakistan-China Import Platform helps Pakistani shopkeepers, wholesalers, retailers, online sellers, small businesses, and first-time importers connect with relevant Chinese factories without needing to travel to China or rely entirely on large local middlemen.

The platform sells a service, not inventory. The core service is factory matching through China-based Factory Match Specialists, known as FMSs. Importers create an Import Project, provide product requirements, choose a package, and either complete payment or save the project as an unpaid lead.

The company operates through a trust-first model: local Pakistani presence, physical verification, field agents, transparent progress tracking, platform-controlled messaging, and clear refund rules. The long-term asset is a growing internal database of factories, prices, MOQs, verification data, FMS performance, and project outcomes.

Core Idea

The visible website should feel simple enough for a local shopkeeper, while the backend is structured like a professional import operating system.

2. Locked Decision Register

The following decisions are locked as the current foundation. They can be revised in later versions, but any revision must be documented in the change log.

ID	Decision	Status
BP-001	Platform helps Pakistani local importers source directly from Chinese factories.	Locked
BP-002	Users create Import Projects, not simple orders.	Locked
BP-003	Chinese sourcing workers are called Factory Match Specialists (FMSs).	Locked
BP-004	FMSs never communicate directly with importers.	Locked
BP-005	Admins control and approve all importer-facing communication.	Locked
BP-006	Importers can verify the Pakistani business physically before placing orders.	Locked
BP-007	Pakistani local agents will market and assist shopkeepers/importers.	Locked
BP-008	Factory signup page remains hidden initially but backend support is built	Locked

	from day one.	
BP-009	Factory database is private at launch and becomes a sourcing intelligence asset.	Locked
BP-010	Importer interface is Urdu-first; FMS/factory interface is Chinese-first; English remains optional.	Locked
BP-011	Payment is expected at project submission.	Locked
BP-012	If user cannot pay, the project can be saved as an unpaid lead.	Locked
BP-013	Full refund before FMS assignment.	Locked
BP-014	After FMS assignment, refund is admin-reviewed and milestone-based.	Locked
BP-015	FMS reassignment may be offered before refund.	Locked
BP-016	Internal messaging system is part of the website from day one.	Locked
BP-017	Future dedicated messaging app will use the same backend/project flow.	Locked
BP-018	Blog content is written in each audience's respective language.	Locked
BP-019	Email/document system uses one premium brand identity and document engine.	Locked
BP-020	Recommended stack: Next.js, Supabase/PostgreSQL, Cloudflare R2, Vercel.	Locked
BP-021	Pricing Version 1: PKR 18,000 / 35,000 / 75,000.	Locked
BP-022	FMS pay Version 1: Bronze/Silver/Gold payout tiers.	Locked
BP-023	FMS Academy and certification are required before paid work.	Locked

3. Business Model

3.1 Core Offer

The platform sells factory discovery, factory matching, factory comparison, and sourcing support. It does not initially sell goods, carry inventory, or guarantee final trade performance unless a future package explicitly includes trade management.

3.2 Revenue Streams

- Paid factory discovery packages.
- Paid factory match packages.
- Paid import partner packages.
- Add-on services such as supplier background checks, video factory tour coordination, price negotiation, sample coordination, and shipping coordination support.
- Future membership for repeat importers.
- Future factory profile and marketplace revenue.

3.3 Long-Term Moat

The moat is the combination of local Pakistani trust, Chinese FMS network, admin-controlled communication, factory data, project history, quality scores, audit logs, and AI-assisted translation/matching. Competitors may copy the website, but not the accumulated operating intelligence.

4. Target Users and Market Positioning

The initial target market is Pakistani importers with budgets from PKR 100,000 to PKR 1,000,000. These customers need access to factories but often lack the budget, language ability, time, or confidence to travel to China.

4.1 Primary Users

- Shopkeepers
- Wholesalers
- Retailers
- Daraz and online sellers
- Small manufacturers
- New entrepreneurs
- First-time importers

4.2 Positioning

Positioning Statement

A Pakistan-based platform that helps local businesses find and connect with suitable Chinese factories without traveling to China.

4.3 Trust Strategy

The website must clearly show that the company is locally verifiable in Pakistan. Local office details, official phone/WhatsApp, verified field agents, and agent code verification should be visible trust features.

5. Language and Localization Strategy

The platform must not force every user into English. Pakistani users see Urdu first, FMSs and factories see Chinese first, and admins operate primarily in English.

Audience	Primary Language	Secondary Language	Design Style
Importer	Urdu	English	Large buttons, icons, voice/photo input
FMS	Simplified Chinese	English	Structured work dashboard
Factory	Simplified Chinese	English	Export opportunity/profile interface
Admin	English	Urdu/Chinese translation view	Operational dashboard

5.1 Blog Content

Blogs should be written natively for each audience. Importer blogs in Urdu/English, FMS recruitment blogs in Chinese/English, and factory growth blogs in Chinese/English.

6. User Roles and Portals

The product should be understood as one backend with multiple role-specific portals.

Portal	Visibility	Users
Public Website	Public	Visitors, importers, FMS candidates, factories
Importer Portal	Public login	Importers
FMS Portal	Approved/invited access	Factory Match Specialists
Agent Portal	Approved access	Pakistani field agents
Admin Portal	Private internal	Operations team
Super Admin Portal	Private internal	Founders/system owners
Factory Portal	Hidden initially	Factories in future phase

Permission Rule

Permissions must be enforced at backend/API/database level. A user must never access another role dashboard by changing a URL.

7. Authentication and Account Access

The authentication system should be unified in backend architecture but separated by portal and user role in frontend experience.

7.1 Importer Signup/Login

- Phone OTP first.
- WhatsApp-based OTP/support preferred.
- Email/password optional backup.
- If phone exists, log in; if not, create a new account after OTP verification.
- Only ask for name, city, and business type after first verification.

7.2 FMS Signup/Login

FMS access should be application/approval/invitation based. Approved FMSs must complete onboarding and certification before paid assignments.

7.3 Admin/Super Admin Login

Internal login should be private, strongly protected, and ideally include two-factor authentication. Admin URLs must not be publicly linked.

7.4 Factory Login

Factory signup/login exists in backend but remains hidden until factory onboarding is activated.

8. Import Project System

Every project, file, payment, message, refund, factory option, and final outcome must connect to one Import Project ID. This is the main organizing unit of the platform.

8.1 Project Creation Inputs

- Take a product photo.
- Upload a product photo.
- Record a voice note.
- Type a product name or description.
- Paste a product link from Alibaba, 1688, or another source.

8.2 Project Statuses

- Draft
- Awaiting Payment
- Payment Received
- Admin Review
- Needs Importer Clarification
- Ready for FMS Assignment
- FMS Assigned
- FMS Working
- Factory Options Submitted
- Admin Quality Review
- Results Released to Importer
- Importer Feedback Requested

- Completed
- Cancelled
- Refunded
- Partially Refunded
- Disputed

8.3 Importer Dashboard

The importer dashboard should remain simple: New Import Project, My Import Projects, Verify Our Agent, Support, and Profile. Avoid unnecessary statistics or complex menus in early versions.

9. Payment, Unpaid Leads, and Refunds

9.1 Paid Project Flow

25. Importer chooses a package.
26. Importer reviews project summary and refund policy.
27. Importer pays.
28. Project status becomes Payment Received.
29. Admin reviews the project before FMS assignment.

9.2 Unpaid Lead Flow

If the user cannot complete payment, they can save the project as an unpaid lead. This captures demand without starting work. Admins or agents follow up to understand the problem and help complete payment.

9.3 Refund Rules

Stage	Refund Rule	Decision Owner
Before FMS assignment	Full refund available	System/Admin
After FMS assignment	Full/partial refund after milestone review	Admin
FMS underperformance	FMS reassignment can be offered before refund	Admin
Service not delivered within promised timeframe	Full refund may apply under policy	Admin/Super Admin

10. Platform-Controlled Communication

No direct contact between importer and FMS is allowed. This protects the business, prevents bypassing, controls quality, protects personal information, and keeps an audit trail.

10.1 Visibility Matrix

Information	Importer	FMS	Admin
Importer phone/WhatsApp	Own only	Hidden	Visible

FMS phone/WeChat/email	Hidden	Own only	Visible
FMS name	Optional alias only	Own only	Visible
Factory contact details	Package-dependent	Visible as needed	Visible
Internal notes	Hidden	Assigned/internal only	Visible

10.2 Factory Contact Release

Factory contact details are released only when the package and workflow explicitly allow it and admin approves release.

11. Integrated Messaging System

Messaging is a core platform module. Each Import Project should have project-based messages, files, voice notes, status updates, admin approvals, translation, and audit logs.

11.1 Message Flow

Importer message -> Admin review -> Admin forwards/translated to FMS if needed -> FMS response -> Admin review -> Importer-facing update released.

11.2 Future Messaging App

The future mobile messaging app should use the same project IDs, user roles, permissions, translation rules, and audit system as the website.

12. Factory Database

The factory database is the most valuable long-term internal asset. It begins as admin-controlled private data and later supports factory profiles, claims, and algorithmic recommendations.

12.1 Factory Fields

- Factory name and Chinese business name.
- Product category and main products.
- City/province and location data.
- Contact person, phone, email, WeChat, website, Alibaba/1688 link.
- MOQ, price range, capacity, certifications.
- Photos, videos, documents, quotations.
- Submitted by FMS, reviewed by admin, trust score, risk flag, last verified date.

12.2 Factory Lifecycle

- Draft
- Submitted by FMS
- Admin verified
- Active in database
- Invited to claim profile
- Claimed by factory
- Suspended

- Blacklisted

13. Factory Match Specialist Operations

FMSs are the China-side operators who find factories and submit structured sourcing reports. Their work is admin-reviewed before anything is shown to importers.

13.1 Locked FMS Compensation Version 1

Tier	Payout Range	Approx. CNY	Use Case
Bronze	PKR 5,000-7,000	¥120-170	Starter/simple projects
Silver	PKR 9,000-12,000	¥220-290	Business/medium projects
Gold	PKR 15,000-25,000	¥370-610	Import Partner/complex projects

13.2 FMS Academy

Every FMS must complete platform training before paid assignments. Training covers workflow, confidentiality, anti-bypass rules, evidence standards, factory verification, communication quality, and ethics.

13.3 Promotion Rules

Bronze to Silver and Silver to Gold promotions should be based on completed projects, ratings, admin quality reviews, punctuality, complaint history, and data accuracy.

14. Pakistani Agent System

Local agents turn online trust into offline trust. They help shopkeepers understand the service, submit projects, verify the company, and complete payment when needed.

14.1 Agent Verification

The website should include an agent verification page. A user enters an agent code and sees active/inactive status, agent name, city/market, approved photo if available, and official contact method.

14.2 Agent Commission

Agent commission should be configurable in admin settings. Version 1 examples: Starter PKR 1,000, Business PKR 2,000, Import Partner PKR 3,000 or a percentage where approved.

15. Admin and Super Admin Operations

The admin portal is the brain of the company. Every operational process must be manageable from the admin dashboard.

15.1 Admin Modules

- Dashboard overview
- Import Projects
- Importer management

- FMS management
- Factory database
- Assignments
- Payments
- Customer support
- Agents
- Reports
- Platform settings
- Audit center

15.2 Admin Daily Workflow

30. Review new paid projects.
31. Review unpaid leads and assign follow-up.
32. Request missing importer information.
33. Assign FMSs.
34. Review submitted factory data.
35. Approve messages/files for importer.
36. Handle refund and reassignment requests.
37. Close completed projects and approve payout records.

16. Email and Document Engine

Emails and documents are part of the product experience. They should look like professional international trade documents, not generic automated emails.

16.1 Brand Rules

Element	Decision
Primary color	Deep navy blue
Accent color	Gold
Success color	Green
Warning color	Orange
Refund/error color	Red
Typography	Inter, Roboto, or Noto Sans
Style	Minimal, premium, formal, high-trust

16.2 Document Engine

Use one reusable document engine for invoices, receipts, refunds, project summaries, FMS assignments, factory introductions, certificates, and reports. Shared components reduce inconsistency and make future updates easier.

16.3 Invoice Requirements

- Invoice number, date, and Project ID.
- Company and customer details.
- Package/service line items, amount, discount/tax if any, total.
- Payment method and transaction ID.
- Status: paid, pending, refunded, partially refunded.
- QR verification link and support footer.

17. Pricing, Unit Economics, and FMS Compensation

Version 1 pricing is designed to be attractive for small Pakistani importers while leaving room for FMS payout, admin cost, agent commission, platform cost, and company profit.

Package	Price	Best For	Factory Options	Delivery Target
Factory Discovery	PKR 18,000	First-time/small importers	3	5-7 business days
Factory Match Plus	PKR 35,000	Established shopkeepers	5	7-10 business days
Import Partner	PKR 75,000	Serious importers	8-10	10-15 business days

17.1 Add-ons

- Extra factory options: PKR 5,000.
- Supplier background check: PKR 12,000.
- Video factory tour coordination: PKR 20,000-35,000.
- Sample coordination: PKR 15,000.
- Price negotiation support: PKR 20,000.
- Shipping coordination support: PKR 15,000.
- Urgent processing: +40%.

18. SEO Strategy

SEO should be planned around three distinct audiences: Pakistani importers, Chinese FMS candidates, and Chinese factories. Each group receives content in the language they search and think in.

Audience	Language	Content Themes
Pakistani Importers	Urdu/English	Import from China, supplier scams, MOQ, product ideas, customs education
Chinese FMS Candidates	Chinese/English	Sourcing careers, overseas buyer work, export support opportunities
Chinese Factories	Chinese/English	Export to Pakistan, buyer leads, factory profile growth, verified importer access

19. Technical Architecture

The project should be built as a modular full-stack platform, not on WordPress, Shopify, Wix, Hostinger builder, Webflow, or any tool that cannot support complex permissions, messaging, files, and workflows.

Layer	Recommended Tool
Frontend/backend app	Next.js
Database/auth/realtime	Supabase/PostgreSQL
Object storage	Cloudflare R2 or Supabase Storage
Deployment	Vercel
Email	Resend initially; Amazon SES later
Payments	Pakistani gateway plus manual/local payment records first
Future app	Same backend APIs

19.1 Configuration Principle

Business rules such as packages, prices, timeframes, refund percentages, FMS payouts, agent commissions, language options, and factory visibility should be configurable wherever practical.

20. Data Storage, Security, and Privacy

20.1 Storage Layers

Structured records belong in PostgreSQL. Large media belongs in object storage. Sensitive contact/company fields should be encrypted or heavily access-controlled.

20.2 File Flow

FMS uploads files -> files are stored securely -> admin review queue -> contact details removed/hidden if necessary -> approved files released to importer account.

20.3 Audit Logs

The platform must log critical actions such as login, project edits, assignments, message approvals, file downloads, refunds, payout approvals, permission changes, price changes, and factory status changes.

21. Roadmap and Future Expansion

Phase	Scope
Phase 1	Importer signup, project creation, payment/unpaid lead flow, admin dashboard, internal factory database, basic FMS assignment
Phase 2	FMS portal, messaging, milestones, file uploads, refund

	center, email/document engine
Phase 3	AI translation, AI project summaries, AI factory matching suggestions, AI customer support
Phase 4	Agent portal, commissions, verification system, local market operations
Phase 5	Factory portal, factory claim system, public factory onboarding, factory SEO expansion
Phase 6	Mobile messaging app and full import operating system

22. Appendix A - Core Workflow Maps

22.1 Paid Project Flow

Visitor -> Importer signup/login -> Create Import Project -> Choose package -> Payment -> Admin review -> FMS assignment -> FMS research -> Admin review -> Results released -> Importer feedback -> Complete -> FMS payout.

22.2 Unpaid Lead Flow

Visitor -> Create Import Project -> Choose package -> Cannot pay/save project -> Project status Awaiting Payment -> Admin/agent follow-up -> Payment completed -> Admin review.

22.3 Refund Flow

Importer requests refund -> System checks whether FMS assigned -> If no FMS assigned, full refund path -> If FMS assigned, admin milestone review -> Possible reassignment/full refund/partial refund/rejection.

22.4 FMS Submission Flow

FMS receives assigned project -> Reviews requirements -> Researches factories -> Uploads evidence -> Submits report -> Admin reviews -> Factory data stored -> Approved results released to importer.

23. Appendix B - Initial Data Model

The following entities should exist or be planned from the start. Fields can be expanded in later versions.

- Users
- User roles
- Importer profiles
- FMS profiles
- Agent profiles
- Factory records
- Import projects
- Project files
- Project messages
- Message approvals
- Payments
- Refunds
- Packages

- Add-ons
- Milestones
- FMS payouts
- Agent commissions
- Audit logs
- Notifications
- Email events
- Document records
- Factory ratings
- FMS quality scores

24. Appendix C - Open Decisions

Area	Open Decision
Brand	Final company/platform name
Domain	Primary domain name
Legal	Pakistani registration structure
Payment	Exact local payment gateways/methods
Office	Public verification address
Support	Official WhatsApp/phone numbers
Email	Final domain email addresses
Legal Docs	Final Terms, Privacy, Refund Policy, FMS Agreement, Agent Agreement
Team	First admin/support operators
Operations	First FMS recruitment process
Compliance	Data handling and business compliance review

End of Version 0.1

This manual is the foundation. Future versions should expand each chapter into detailed screen-by-screen PRDs, database specifications, API requirements, templates, SOPs, and acceptance tests.
